

ALL STAR SPORTS COMPLEX TEST SITE

By Bob Richardson (Soil Restoration Technologies) and
Shane Kiellson (All Star Sports Complex)

QUESTION

Does the application of Turf2Max on areas affected by Spring Dead Spot (SDS) accelerate turf recovery during the growing season?

PURPOSE

To compare and determine the effectiveness of Turf2Max on areas affected by SDS, versus standard fertilizer practices without Turf2Max application.

TEST SITE

All Star Sports Complex is a nationally recognized Boys Baseball Complex. Each year starting the week of the 4th of July, there are three consecutive Little League World Series Tournaments, each lasting for one week. Before and after the tournaments, constant use of the fields impact the turf, thereby creating a huge challenge for turf maintenance. Shayne Kjellson maintains a large staff of workers to constantly maintain all of the fields.

Shayne was very interested in trying Turf2Max to help maintain turf quality throughout the heavy use season. In particular interest, because of the increased challenge of the SDS affliction, he wanted to see if Turf2Max could expedite turf recovery in the affected areas. It

is crucial for the complex to provide high quality playing areas in light of the large national tournaments.

Two baseball outfields (Tifway Bermuda) affected by SDS were selected for the test. Each field had moderate SDS affliction, with afflicted spots ranging from 12" up to 30" across. The unaffected areas are in very good condition as far as turf quality, due to excellent cultural practice. The outfield of Field 6 will be used as the treated site, and the adjacent outfield of Field 7 will be the untreated site.

CONTROL

All fields are mowed and irrigated on a consistent, equal basis supervised by Shayne Kjellson, Turf Manager. Fertilization is applied by TruGreen ChemLawn as directed by Shayne.

APPLICATION

On May 13, 2001 Turf2Max was applied at the dilution rate of 2oz Turf2Max per 1 gallon of water at a coverage rate of 4oz Turf2Max per 1000 square feet to Field 6, applied by TruGreen Chemlawn. Irrigation of ¼" immediately followed the Turf2Max application.

RESULTS

On June 13th, 2001 a visual inspection of Field 6 and Field 7 demonstrated a remarkable difference in SDS recovery. All of the visible affected areas were 95-100% recovered on Field 6. The affected areas on Field 7 were recovering, however at a much slower rate. Approximately 50-75% of the afflicted areas on Field 7 have recovered. Shayne made a

decision to go ahead and treat Field 7, Field 1, and all of the infields to enhance turf quality before the three large tournaments.

On July 2, 2001 a visual inspection of Field 6 indicates a full recovery from SDS. Field 7 shows a 90-95% recovery on this date.

CONCLUSION

No claim is made that Turf2Max will cure or prevent SDS, however the application of Turf2Max on areas afflicted will speed up the recovery process during the growing season. Further tests are planned to examine if Turf2Max can help prevent re-occurrence of SDS.
